CAMS prior to surgery - for a dramatic recovery

Kenneth Dobbs is no stranger to "replacement" surgery. He has had both knees replaced. Recently, he had his hip replaced and couldn't believe how well his body responded during recovery. What made the difference? Ken thinks it was the

six months of CAMs therapy he received prior to surgery.

"I've been using the RJV CAMS unit for the last six months. That's the unit programmed with anti-aging/telomere-lengthening frequencies," says Ken. "Not only do I think it helped prepare me for surgery, I also think it kept my hip from becoming too painful prior to the procedure."

Hip replacements vary. As with any surgery, there are multiple factors. Generally, the younger a patient is and the better shape they are in, the easier the recovery. For Ken (age 75) the RJV unit may have influenced both!

"I was walking the afternoon of the surgery,"

says Ken. "Nobody expected that. I felt so good, they released me two days later."

Typically after hip replacement, a patient is only encouraged to sit on the edge of the bed the first day. In order to be discharged, they have to be able to walk 1200--2000 steps. That usually takes 3 to 5 days. In Ken's case, he was able to walk 2800 steps - and in record time.

The newest CAMS unit (TensCam/RJV Jr.) uses the same solid state quartz technology to change light and electrical input to scalar output. When directed towards the human body with intention, it re-establishes the body's normal frequency patterns and balances the bio-energetic field. In addition, the new RJV unit can be set to apply a specific band of regenerative frequencies identified as the resonance of healthy chromosomes. Research suggests these frequencies may lengthen telomeres and have other anti-aging benefits. Those in the pilot study are experiencing unprecedented changes. If you are interested in more information about this new unit contact us.
